| STAT 659 —  | Final | Exam |
|-------------|-------|------|
| Spring 2015 |       |      |

| Name: |  |
|-------|--|
|       |  |

## INSTRUCTIONS FOR THE STUDENT:

- 1. You have exactly 2 hours to complete the exam.
- 2. There are 11 pages including this cover sheet and 3 pages of SAS output.
- 3. Each lettered part of a question is worth 7 points unless otherwise marked.
- 4. Please answer all questions.
- 5. Show all your work on the test booklet.
- 6. Do not discuss or provide any information to any one concerning any of the questions on this exam or your solutions until I post the solutions.
- 7. You may use a calculator that does not have the capability of phoning, texting, or accessing the internet and three  $8\frac{1}{2} \times 11$  formula sheets (you may use both sides). Do not use the textbook or class notes.
- 8. Carry out tests at level 0.05 unless otherwise stated.
- 9. Be sure to clearly state the hypotheses, the test statistic and its value, and conclusion for all tests.

I attest that I spent no more than 2 hours to complete the exam. I used only the materials described above. I did not receive assistance from anyone during the taking of this exam.

## INSTRUCTIONS FOR PROCTOR:

| (1) Record the time at which the student starts the exam: | (1) | Record the time at which the student starts the exam: |  |
|---|-----|---|--|
|---|-----|---|--|

|  | ids the exam: | the student | which | time at | ord the | 2) Re | (2) |
|--|---------------|-------------|-------|---------|---------|-------|-----|
|--|---------------|-------------|-------|---------|---------|-------|-----|

- (3) Immediately after the student completes the exam, please scan the exam to a .pdf file and have the student upload it to webassign.
- (4) Collect all portions of this exam at its conclusion. Do not allow them to take any portion with them.
- (5) Please keep these materials until May 18, at which time you may either dispose of them or return them to the student.

I attest that the student has followed all the INSTRUCTIONS FOR THE STUDENT listed above and that the exam was scanned into a pdf and uploaded to webassign in my presence:

## Proctor's Signature\_\_\_\_

Some Chi-Squared Percentiles

|    | Ri    | ity   |       |       |
|----|-------|-------|-------|-------|
| df | 0.100 | 0.050 | 0.025 | 0.010 |
| 1  | 2.71  | 3.84  | 5.02  | 6.63  |
| 2  | 4.61  | 5.99  | 7.38  | 9.21  |
| 3  | 6.25  | 7.81  | 9.35  | 11.34 |
| 4  | 7.78  | 9.49  | 11.14 | 13.28 |
| 5  | 9.24  | 11.07 | 12.83 | 15.09 |
| 6  | 10.64 | 12.59 | 14.45 | 16.81 |
| 7  | 12.02 | 14.07 | 16.01 | 18.48 |
| 8  | 13.36 | 15.51 | 17.53 | 20.09 |
| 9  | 14.68 | 16.92 | 19.02 | 21.67 |
| 10 | 15.99 | 18.31 | 20.48 | 23.21 |

Some Normal Percentiles

| Right-Tail Probability |       |       |       |       |  |  |  |  |  |
|------------------------|-------|-------|-------|-------|--|--|--|--|--|
|                        | 0.100 | 0.050 | 0.025 | 0.010 |  |  |  |  |  |
|                        | 1.282 | 1.645 | 1.960 | 2.326 |  |  |  |  |  |

1. In the 2008 General Social Survey, males were asked the questions "How proud are you of America's economic achievements?" and "How proud are you of America's scientific and technological achievements?" resulting in the following table:

|                  | Science and Technology |                |                |                  |  |  |  |  |  |  |
|------------------|------------------------|----------------|----------------|------------------|--|--|--|--|--|--|
| Economic         | Very Proud             | Somewhat Proud | Somewhat Proud | Not Proud At All |  |  |  |  |  |  |
| Very Proud       | 369                    | 59             | 6              | 1                |  |  |  |  |  |  |
| Somewhat Proud   | 226                    | 238            | 10             | 3                |  |  |  |  |  |  |
| Not Very Proud   | 60                     | 67             | 14             | 2                |  |  |  |  |  |  |
| Not Proud At All | 7                      | 16             | 3              | 2                |  |  |  |  |  |  |

(a) The survey responses were dichotomized by combining the  $Very\ Proud$  and  $Somewhat\ Proud$  categories into the Proud category and the other two categories into the  $Not\ Proud$  category. The resulting  $2\times 2$  table appears below. Test whether the proportion of males rating economics as Proud differs from the proportion rating science and technology as Proud.

|           | Science a | Science and Technology |       |  |  |  |  |  |  |
|-----------|-----------|------------------------|-------|--|--|--|--|--|--|
| Economic  | Proud     | Not Proud              | Total |  |  |  |  |  |  |
| Proud     | 892       | 20                     | 912   |  |  |  |  |  |  |
| Not Proud | 150       | 21                     | 171   |  |  |  |  |  |  |
| Total     | 1042      | 41                     | 1083  |  |  |  |  |  |  |

- (b) Using the data in a), estimate the marginal odds ratio for rating economics as *Proud* relative to rating science and technology as *Proud*. Then obtain the conditional maximum likelihood estimate for the corresponding conditional odds ratio in the subject specific model.
  - Marginal odds ratio

• Conditional odds ratio

(c) Several models were fit to the data in the original four-by-four table resulting in the deviances and degrees of freedom in the following table:

| Model                     | Deviance | Degrees of Freedom |
|---------------------------|----------|--------------------|
| Independence              | 210.4    | 9                  |
| $\operatorname{Symmetry}$ | 218.0    | 6                  |
| Quasi-independence        | 10.5     | 5                  |
| Ordinal quasi-symmetry    | 8.89     | 5                  |
| Marginal homogeneity      | 197.9    | 3                  |
| Quasi-symmetry            | 3.42     | 3                  |

Discuss the fit of these models and select the most appropriate model(s).

- (d) Carry out tests for marginal homogeity in two ways:
  - Test the fit of the model labeled "Marginal homogeneity".

• Assuming the quasi-symmetry model holds, carry out a test for marginal homogeneity of the data.

- 2. In the homework, you studied a data set from the MBTI Step II National Sample (collected and compiled by CPP, Inc.) on whether a sample of individuals report drinking alcohol frequently (Y=1 if yes, =0 if no) and on the four binary scales of the MyersBriggs personality test: Extroversion/Introversion (E/I), Sensing/iNtuitive (S/N), Thinking/Feeling (T/F) and Judging/Perceiving (J/P). The 16 predictor combinations correspond to the 16 personality types: ESTJ, ESTP, ESFJ, ESFP, ENTJ, ENTP, ENFJ, ENFP, ISTJ, ISFP, ISFP, INTJ, INTP, INFJ, INFP. You fit logistic regression models using the four scales as predictors of  $\pi=$  the probability of drinking alcohol frequently.
  - (a) Various logistic regresion models including interactions were fit to the data. Use the following table to choose the most appropriate models among those included in the table.

| Model   | $G^2$ | AIC   | df |
|---|-------|-------|----|
| Main effects only                                 | 11.15 | 637.5 | 11 |
| Main effect and all 2-factor interactions         | 3.74  | 642.1 | 5  |
| Main effects and all 2- and 3-factor interactions | 0.14  | 646.5 | 1  |
| Saturated model                                   | 0.00  | 648.3 | 0  |

(b) Starting with the main effects model, six models were fit where each 2-way interaction term was included one at a time with the main effects. Since the EI\*JP and SN\*TF interactions were the only ones that had p-values smaller than 0.15 in their models, a new model with all the main effects and the two interactions EI\*JP, SN\*TF were fit to the data. The model had a deviance of 5.23 with 9 degrees of freedom. Carry out likelihood ratio tests to determine which of the three models you prefer among (i) this model, (ii) the model with all the main effects, and (iii) the model with all the main effects and two-way interactions.

(d) Using the SAS output for the logit model with main effects only, estimate the odds ratio for being alcoholic for a person of personality type ESTJ (i.e., EI=E,SN=S, etc.) relative to a person with personality type INTJ.

| (e) | Using   | the SA | AS outpu   | t for           | the logi  | t mode | l with   | main    | effects | only, | determin  | ne which  | personality  |
|-----|---------|--------|------------|-----------------|-----------|--------|----------|---------|---------|-------|-----------|-----------|--------------|
|     | type ha | as the | smallest : | $\hat{\pi}$ and | l explain | why th | nis is t | he case | e based | on th | e model p | parameter | r estimates. |

- (f) We now look at the relationship between the TF scale and Y in two ways.
  - i. Use this table below to estimate the marginal odds ratio between the thinking and feeling personality types and frequent alcohol drinking.

|             | Drink Alcohol Frequently |     |       |
|-------------|--------------------------|-----|-------|
| Personality | Yes                      | No  | Total |
| Thinking    | 49                       | 351 | 400   |
| Feeling     | 48                       | 602 | 650   |
| Total       | 97                       | 953 | 1050  |

ii. Use the logit model with main effects only to estimate the conditional odds ratio between the thinking and feeling personality types and frequent alcohol drinking keeping all the other three scales constant. 3. A study was carried out to investigate the relationship between regular smoking and major depressive disorder. A sample of 3213 individuals were classified according to regular smoking habit (smoke), major depressive disorder (depress), and gender (gender), a variable also thought to be related to major depressive disorder. Various loglinear models identified by the first letter of the explanatory variable were fit to the data. Use the accompanying SAS output to help you answer this problem. Use the following table to help you answer this problem.

| Model                | $G^2$ | df |
|----------------------|-------|----|
| $\overline{(D,G,S)}$ | 159.2 | 4  |
| (G,DS)               | 136.4 | 3  |
| (D,GS)               | 57.1  | 3  |
| (S,DG)               | 135.1 | 3  |
| (DG,GS)              | 33.0  | 2  |
| (DS,GS)              | 34.4  | 2  |
| (DG,DS)              | 112.3 | 2  |
| (DG,DS,GS)           | 0.77  | 1  |
| (DGS)                | 0.0   | 0  |

(a) Carry out a test of equal odds ratios for between smoke and depress for males and females.

(b) Assuming that the homogeneous association model holds, carry out a test of partial association of smoke and depress, controlling for gender.

| Model      | $G^2$ | df |
|------------|-------|----|
| (D,G,S)    | 159.2 | 4  |
| (G,DS)     | 136.4 | 3  |
| (D,GS)     | 57.1  | 3  |
| (S,DG)     | 135.1 | 3  |
| (DG,GS)    | 33.0  | 2  |
| (DS,GS)    | 34.4  | 2  |
| (DG,DS)    | 112.3 | 2  |
| (DG,DS,GS) | 0.77  | 1  |
| (DGS)      | 0.0   | 0  |

(c) Based on the table of deviances, which model would you recommend? Be sure to justify your answer.

- (d) Estimate the odds ratio between gender and depress for a regular smoker (smoke=yes) using: the homogeneous association model and the saturated model. SAS output for these models is provided.
  - Homogeneous association model

• Saturated model
